

Global Bioenergies enters into an agreement with a German car manufacturer

Evry (France), November 14th, 2011 – Global Bioenergies S.A. (FR0011052257 – NYSE Alternext: ALGBE), today announces the signature of an agreement with a major German car manufacturer regarding an undisclosed application of its technology.

Global Bioenergies develops direct fermentation processes to convert renewable resources into light olefins such as isobutene and butadiene. Those molecules are source material for several applications in the fields of fuel production and the chemical industry.

The society increasingly demands solutions with respect to a sustainable mobility. In that regard, several applications of Global Bioenergies' molecules are relevant for the car industry, one of which is the subject of the present agreement.

Marc Delcourt, CEO of Global Bioenergies, comments: *“This prominent car manufacturer has a long term vision to take sustainability as an integral part of the entire value chain, which we aspire to be part of. This involves intelligent mobility solutions, be it with respect to the energy source powering cars or the materials employed, such as plastics. It prepares the build-up of a very promising partnership for the years to come.”*

About Global Bioenergies

Global Bioenergies is one of the few companies worldwide, and the only one in Europe, that is developing a process to convert renewable resources into hydrocarbons through fermentation. The Company initially focused its efforts on the production of isobutene, one of the most important petrochemical building blocks that can be converted into fuels, plastics, organic glass and elastomers. Global Bioenergies continues to improve the yield of its process and prepares the phase dedicated to pilot testing. The company is also looking to replicate this success with other members of the gaseous olefins family (propylene, ethylene, linear butylenes, butadiene...), key molecules at the heart of petrochemical industry.
